

Lecture 1 + 2 Techniques Used

For the first assignment, I made a website dedicated to capybaras. This website displays a list of reasons capybaras are wonderful, including a link to another website with capybara facts. The website includes a “slideshow” of capybara images that can be changed with the click of a button. From the first lecture video, in `capy_files.html`, I used the tags for creating numbered lists (``), hyperlinks (`<a>`), and inserting an image (``). From the first lecture, I also learned how to use CSS to stylize elements of the website in `capy_files.css`. I made the bullet and button text in Georgia font using the `.body` class. I also centered the body of the website (`.content` class) and centered the button (`.center` class). From video 3, I applied the techniques for using javascript to make a website interactive. I wrote `setImg()`, a function that changes the image src when the button is clicked, forming a rudimentary slide show (see `capy_files.js`). I also referenced w3 schools in addition to the lecture videos.
